

## Assessment of Mining-Related Hazards

The geotechnical hazards associated with shallow mine workings, mine shafts and adits can be significant to any development. ALM Consult Limited can initially assess the risk of recorded or unrecorded mine workings at Desk Study stage by review of our extensive library of detailed geological plans and inspection of mine abandonment plans and other records. Targeted drilling programmes can be subsequently carried out under our full supervision to prove the underlying strata and presence of mine workings and mine entries.

ALM Consult Limited has experience in the assessment of not just coal-related mine workings, but also mineral workings associated with Fullers Earth, Elland Flagstone and Limestone.

Detailed specifications for the licensed treatment of shallow workings can be prepared by ALM Consult Limited with full supervision and verification reporting.
